PAVER MAINTENANCE

WHILE MOST SURFACES NEED REPLACED, SUCH AS CONCRETE AND ASPHALT, BRICK PAVERS AND NATURAL STONE CAN BE RE-LAID IN MOST INSTANCES.

RELAYING:

settled or raised pavers by correcting base issues, and reinstalling evenly for proper water drainage and recompacting.

Most often pavers can be removed and re-laid, instead of being completely replaced.

RESANDING / REMORTARING:

Thoroughly brushing in between pavers jointing sand or mortar in stone to stabilize and help control regrowth of weeds or moss.

- When some pavers need replaced, we blend the new and old pavers in the best way possible to minimize the difference.
- PVC edging usually has to be replaced to secure the edges of the pavers or stone.
- Stone can only be re-used if not set in mortar.

We usually recommend Polymeric sand instead of concrete to fill joints for this reason.

POWER WASHING:

Thoroughly power washing pavers that may be heavily soiled, covered in stains from chemicals or fuels, and overgrowth of moss.

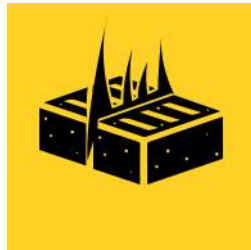

This process can help re-expose the color of your pavers and stone leaving a beautiful clean and polished look.

WHEN IT IS TIME FOR MAINTENANCE?

IF YOU NOTICE ANY OF THE FOLLOWING ISSUES:

Settling and water ponding in various areas.

Grass growing in joints.

Crumbling or deterioration and discoloration of old pavers.

PVC edging missing or lifted (pavers shifting or settling on edges indicate this issue).
